

1.Connect a USB webcam to your computer, install any required drivers, and verify that the webcam works by opening the default camera app and capturing a photo.

Ans.

Step 1: Connect the webcam

First, I connected the USB webcam to an available USB port on the computer. I made sure that the USB connector was properly inserted.

Step 2: Check webcam detection

After connecting the webcam, I waited for Windows to detect the device. A notification may appear when the webcam is successfully detected.

Step 3: Install the driver

Windows usually installs the required webcam driver automatically. If the driver is not installed, I would install the driver provided by the webcam manufacturer.

Step 4: Check camera permission

I opened Settings → Privacy → Camera and checked that camera access was turned ON. I also allowed apps to access the camera.

Step 5: Open the Camera app

I opened the Camera app from the Windows Start menu. The webcam should show a live video on the screen.

Step 6: Check the video quality

I checked whether the video was clear and whether the webcam was working without any error message.

Step 7: Capture a photo

I clicked the Capture/Photo button in the Camera app and took a photo using the connected webcam.

Step 8: Check the captured photo

I opened the captured photo and checked that the image was saved correctly and was clear.

Step 9: Final verification

After completing these steps, I confirmed that the USB webcam was properly connected, detected by Windows, and working correctly.

Result: The USB webcam was successfully connected to the computer and tested using the Windows Camera app by capturing a photo.

2. Set up a local printer (USB or network), install the correct driver, and print a test page to confirm successful installation.

Ans.

Step 1: Connect the printer

First, I switched ON the printer and connected it to the computer using a **USB cable**. I checked that the cable was properly connected.

Step 2: Check the printer

I made sure that the printer had enough paper and ink/toner. I also checked that there was no error message on the printer.

Step 3: Install the printer driver

Windows may automatically detect the printer and install the required driver. If it does not, I installed the correct driver for the printer model.

Step 4: Open printer settings

I opened **Settings → Devices → Printers & scanners** and checked whether the printer was displayed in the list.

Step 5: Select the printer

I selected the connected printer and checked its status. It should show that the printer is **Ready/Online**.

Step 6: Set the printer as default

If required, I selected the printer and set it as the **default printer** so that it can be used easily for printing.

Step 7: Print a test page

I opened the printer settings and selected the **Print Test Page** option. The printer then printed a test page.

Step 8: Check the test page

I checked the printed page to make sure the text and other details were printed clearly without any major problem.

Result: The printer was successfully connected, the correct driver was installed, and a test page was printed successfully.

3. Simulate a connectivity issue by unplugging the printer's USB cable, then use Windows Device Manager to identify and resolve the 'printer not detected' problem.

Ans.

Steps:

1. First, turn on the printer and connect it to the computer using a USB cable.
2. Unplug the USB cable to simulate the connectivity problem.
3. Open **Device Manager** from the Windows search bar.
4. Check **Printers**, **Print queues**, or **Universal Serial Bus controllers** for the printer.
5. Look for any **yellow warning or error icon** near the printer device.
6. Reconnect the USB cable properly.
7. In Device Manager, click **Action → Scan for hardware changes**.
8. Wait for Windows to detect the printer again.
9. Check whether the printer appears without any error icon.
10. Print a test page to confirm that the printer is working.

Result: The printer was detected again after reconnecting the USB cable and scanning for hardware changes.

4.You are helping a friend whose printer is showing 'offline' status on their PC. Describe how you would use the Windows Troubleshooter tool to try to fix the issue, and explain what information the tool provides during the process.

Ans.

Steps:

1. First, open the default Camera app in Windows and check whether the webcam is working properly.
2. If the webcam works in the Camera app, close the Camera app completely before opening Zoom.
3. Close other applications such as Microsoft Teams, Skype, Google Meet, or any other app that may be using the webcam.
4. Open Zoom and click on Settings.
5. Go to the Video option and check the camera preview.
6. Select the correct webcam from the camera list if more than one camera is available.
7. Open Windows Settings → Privacy & Security → Camera and make sure Camera access is turned on.
8. Also make sure that Allow desktop apps to access your camera is enabled so that Zoom can use the webcam.
9. Close Zoom and open it again after changing the camera permission.
10. Check the video preview in Zoom and start a test meeting to confirm that the webcam is displaying video.
11. If the problem still occurs, restart the computer and connect the webcam again.
12. Finally, open Zoom and check the camera once more.

Result: The webcam was working in the Camera app, and after closing other apps and enabling the required camera permissions, it worked properly in Zoom.
